MIS Implants poised for growth in 2014 with new products, team

By MIS Implants Technologies Staff

Since establishing the U.S. distributorship of MIS Implants Technologies more than 10 years ago, CEO Motti Weisman has led the company to experience significant growth year after year. This year, however, is one with even greater potential as the company expands with new products and a growing team of outside sales representatives.

One of the most exciting innovations that the company launched recently is the MGuide guided surgery system. It has already received enthusiastic reviews by the doctors who have used this service, according to MIS. There is no initial investment in software, as it does not need to be purchased. Planning is done by the doctor and MCenter technicians. The doctor provides specific digital files and impressions or stone models.

This data is transferred to the advanced MGuide software and a phone appointment is then scheduled between the doctor and the MCenter technician. At this time, the technician "shares" his computer screen, so the doctor can direct the planning process. Once the plan is approved by the doctor, he "shares" his computer screen with the technician. At this time, the technician can direct the planning process.

The MGuide surgical stent is unique in a number of ways, MIS says. The stent is designed to be as open as possible to facilitate improved visualization and irrigation. Also, there are no "keys" through which the osteotomy is traditionally created. Instead, those metal sleeves are preset to the precise height to achieve the predetermined depth of the osteotomy. The implant itself can also be placed through the stent, if the clinician desires. Without those keys, there is greater access to the posterior section of the mouth. Additional information and videos can be seen at www.mcenterusa.com.

The MIS regenerative portfolio has also recently grown. Partnering with TissueNet of Orlando, Fla., MIS has now added allograft products, which include cortical cancellous and cortico/cancellous products. These are packaged in vials ranging from .25 cc (perfect for a small, single-tooth extraction) to 5 cc in volume. There are also xenografts as well as synthetic products in its 4Bone line.

The BondBone product, a unique biphasic calcium sulfate grafting material, is comprised of a proprietary combination of hemihydrate and dihydrate calcium sulfate powder. Preset seed particles allow it to set in the mouth without being affected by blood or saliva. It can be used as a stand-alone product or as part of a composite graft with other granular grafting materials. When used in the latter manner, it acts like a cement, bonding the normally transient particles to the recipient site.

The MIS sales force also saw expansion during the past year as territories were added in multiple states. Along with new field representatives, the sales management team has also grown. Three new regional managers have been added to oversee local representatives. All regional managers came to the company with strong dental implant management experience and are an excellent resource for the newer as well as experienced reps. The managers as well as several of the newer reps have already successfully completed training in Israel and as training in the U.S. corporate offices.

MIS Implants Technologies is first and foremost a dental implant company. Its flagship Seven system continues to benefit doctors by offering a high-quality product with a wide variety of restorative options, the company asserts. Single, multi-unit, custom abutments and more are all options with this system.

New to the MIS family of implants is the C1 system. This features a conical connection and platform switching. Simplicity is key for all MIS products, and the C1 with its simple surgical kit is no exception.

MIS products are sold globally in more than 60 countries, making it one of the largest dental implant companies in the industry. With a state-of-the-art manufacturing and research and development facility in Israel, MIS is poised to continue to increase its market share with new and innovative products.

Weisman is dedicated to offering excellent products and service. As MIS’ team has noted: It is no wonder that a company with his leadership is on such a growth trajectory. Please visit www.misimplants.com to learn more.

LEGEND FRAME

Orascoptic, a leader in vision solutions for dental and medical professionals, introduces the iconic Legend frame. Designed by Rudy Project®, the Legend brings the iconic styles of the 1940s to modern day.

Built with performance in mind, the Legend’s aluminum base is durable enough to support the complete line of Orascoptic loupes and headlights. Adjustable temple arms and saddle nose pad, along with a variety of sizes, also allows the user to customize the frame for the ideal fit.

The Legend is available in black, slate and twist, and supports all types of prescriptions.

Founded by a dentist in 1981, Orascoptic has been designing and manufacturing award-winning loupes and light systems in Middleton, Wis., for 30 years.

To check out the Legend frames, stop by the Orascoptic booth, No. 1616, here at the CDA Presents.
